DECLARATION

I declare that this thesis entitled “Stability and Thermal Properties of Hydroxyl Multiwalled Carbon Nanotubes in Different Medium” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Supervisor Name :

Date :

DEDICATION

To Allah s.w.t, Alhamdulillah for your blessings.

To my beloved Emak, Abah, Adik, Anis, Tok, Tokwan and Yayang.

Thank you for your love, understand and support.

May Allah grant us a forever Jannah.

To supervisor,

Thank you for your support, knowledges, guidance, and patience.

May Allah grant you goodness and blessings.

ABSTRACT

Nanotechnology has introduced nanofluids as suspension of nanoparticles in the base fluids. The nanoparticles dispersion in fluids due to thermal properties limitation. Hence, inclusion of MWCNT-OH nanoparticles and PVP in base fluids could enhance the thermal properties and the nanofluids stability. Furthermore, the low boiling point and high freezing point of deionized water has caused another problem and be solved by mixing this fluid with ethylene glycol which acts as antifreeze fluid. Intention of this research is to investigate the nanofluid dispersion and stability and as well as thermal properties performance. The two-step method is used in formulation of nanofluid on concentration 0.1 wt% to 1.0 wt% of MWCNT-OH and base fluid deionized water to ethylene glycol ratio is 0:100%, 100:0%, 90:10%, 80:20%, 70:30%, 60:40% and 50:50%. The dispersion process has selected 5 minutes dispersion process as the optimum time in getting better dispersion and stability of nanofluids. The nanofluids have been tested at 6°C, 25°C and 40°C in thermal conductivity and heat transfer coefficient test. In thermal conductivity test, addition of MWCNT-OH in deionized water is the highest thermal conductivity enhancement which 21.21% (0.4 wt%) at 40°C. However, the thermal conductivity decrement also happens on deionized water based nanofluids at range concentration 0.3 wt% and 0.5 wt% till 1.0 wt% at 40°C. Moreover, the thermal conductivity results are fluctuated or inconsistent with increment of temperature and concentration. Hence, it means thermal conductivity is independent on temperature and concentration. Meanwhile, heat transfer coefficient increases with increment of temperature and nanoparticles concentration. The highest enhancement of heat transfer coefficient occurs on ratio 70:30;DI:EG which has 104.3% at 40°C and 1.0 wt%. The overall increment of heat transfer coefficient occurs on 1.0 wt% and 40°C. Only on 0:100; DI:EG, and 60:40; DI EG has the highest enhancement on 25°C. Besides, ethylene glycol based nanofluids has high heat transfer coefficient on 6°C. In specific heat test, addition of MWCNT-OH has decreased the specific heat on 0.8 wt% of ethylene glycol based nanofluids. This test is conducted in room temperature. Based on these results, concentration, nanoparticles properties and coagulation in nanofluids causes specific heat decrement. Whilst, surface energy, nanoparticles size and area are contributed in high specific heat. To sum up, seeding of MWCNT-OH in fluids has enhanced the thermal properties on certain concentration and temperature.

ABSTRAK

Teknologi nano telah memperkenalkan bendalir nano sebagai dispersi partikel nano ke dalam bendalir konvensional. Ini disebabkan bendalir konvensional mempunyai keupayaan yang terhad dari segi sifat-sifat termal. Oleh demikian, penggunaan partikel MWCNT-OH dan PVP ke dalam bendalir dipercayai dapat meningkatkan sifat-sifat termal dan kestabilan bendalir nano. Tambahan lagi, masalah takat didih yang rendah dan takat beku yang tinggi pada air ternyahion dapat ditangani dengan menggunakan bendalir antibeku seperti etilena glikol. Tujuan kajian ini adalah untuk menyiasat dispersi dan kestabilan bendalir nano dan juga prestasi sifat-sifat termal bendalir nano. Kaedah dua langkah telah digunakan dalam penghasilan bendalir nano pada kepekatan MWCNT-OH dari 0.1 wt% hingga 1.0 wt% dan nisbah bendalir asas pada 0:100%, 100:0%, 90:10%, 80:20%, 70:30%, 60:40% dan 50:50%. Proses dispersi telah memilih 5 minit waktu proses dispersi sebagai masa terbaik dalam penghasilan bendalir nano yang stabil. Bendalir nano telah diuji pada tiga suhu yang berbeza iaitu 6°C, 25°C and 40°C pada ujian kekonduksian termal dan ujian kecekapan pemindahan haba. Dalam ujian kekonduksian termal, penambahan MWCNT-OH dalam air ternyahion mempunyai peningkatan kekonduksian termal paling tertinggi iaitu 21.21% (0.4 wt%) pada suhu 40°C. Namun, penurunan kekonduksian termal turut berlaku pada bendalir nano air ternyahion pada kepekatan 0.3 wt% dan 0.5 wt% hingga 1.0 wt% pada suhu 40°C. Tambahan lagi, hasil kekonduksian termal adalah tidak konsisten dengan peningkatan suhu dan kepekatan. Oleh yang demikian, ini bermakna kekonduksian termal tidak bergantung pada suhu dan kepekatan. Manakala, hasil kecekapan pemindahan haba meningkat dengan meningkatnya suhu dan kepekatan partikel nano. Peningkatan tertinggi kecekapan pemindahan haba iaitu 104.3% berlaku di nisbah 70:30;DI;EG pada suhu 40°C dan 1.0 wt%. Peningkatan kecekapan pemindahan haba keseluruhannya berlaku pada 1.0 wt% dan suhu 40°C. Hanya 0:100; DI:EG, dan 60:40; DI EG mempunyai peningkatan kecekapan pemindahan haba tertinggi pada suhu 25°C dan etilena glikol bendalir nano pada suhu 6°C. Di dalam ujian haba tentu yang dilakukan dalam suhu bilik menunjukkan penurunan haba tentu pada setiap bendalir nano kecuali pada 0.8wt% etilena glikol bendalir nano. Analisis mendapati kepekatan partikel, sifat partikel nano dan mendapan dalam bendalir nano merupakan faktor penurunan haba tentu. Walau bagaimanapun, tenaga permukaan, saiz partikel dan kawasan permukaan partikel menyumbang kepada peningkatan haba tentu. Natijahnya, penambahan partikel MWCNT-OH dalam bendalir dapat meningkatkan sifat-sifat termal pada kepekatan dan suhu tertentu sahaja.

ACKNOWLEDGEMENTS

This thesis becomes a reality with the kinds of support and guidance of many individuals. Foremost, I want to say “Alhamdulillah” and thanks to Almighty *ALLAH* for giving me a strength, peace of mind and good health in order to complete this research. I would like to express my special gratitude and thanks to my supervisor, En. Imran Syakir bin Mohamad for the imparting his knowledge and expertise in this research. Furthermore, I want to express my deepest appreciation to my co-supervisor, Associate Professor Dr. Ahmad Yusairi bin Bani Hashim for his guidance and invested to help me to complete this research. Besides, I would like to express my extreme sincere gratitude to Dr. Norli binti Abdullah (UPNM) for her endless help and support during my study. Many thanks to Puan Rusni binti Hasan as UTeM Technician for her assistance in my experiments. Special appreciation to Ministry of Higher Education (MOHE) under the grant of FRGS/2/2013/SG02/FKP/02/2/F00176 and Zamalah UTeM Scholarship for providing a financial support. I submit my heartiest appreciation to my nano research team, friends and concerned person for their support. Lastly, not forgotten, I also would like to express thanks to my family, my husband and family in-law for their moral support, love and care that truly encourage me to finish this study. The moment during this study is a priceless moment in my life.
